1. PROJECT OVERVIEW

The descriptions and computations included within this Engineering Report and Appendix are provided in support of the improvement of the parking lot / loading area and development of new parking area, located at #69 Leggett Street Drive in East Hartford, CT. The current permit applications are for the approvals of a site plan application Town of East Hartford Planning and Zoning Commission.

The overall project will consist of the development of a property located at the westerly side of Leggett Street. The development of this site will consist of the redevelopment of the existing parking lot and loading area along the southerly side of the existing building on this site and the development of a new 11 space parking lot at the northeasterly corner of the site.. This parking lot is being constructed as part of the redevelopment of the existing 71,615 sq. ft. building . The access to these parking lots will be through the existing curb cut from Leggett Street along the southerly side of the site new driveway curb cut from Leggett Street at the northeasterly corner of he site.

The storm water management system for this site has been designed utilizing Best Management Practices (BMPs) and Low Impact Development (LID) methods to improve the storm water quality and to attenuate the peak flows rates and volumes, to prevent increases in the pre-development runoff rates to the existing drainage system in Darlin Street. The overall storm water management system will uses underground detention systems, along with several other water quality measures before discharging storm water to the receiving drainage system. The goal of the storm water management design is to provide removal of total suspended solids while attenuating the post development peak runoff rates and volumes. For more detailed information regarding storm water quantity, refer to Section 3 and Section 4 of this report. Refer to Section 5 for storm water quality management provided in the proposed design. Design computations and other relevant information are provided in the Appendix of this report.

2. EXISTING SITE CONDITIONS

The project site is located along the westerly side of Leggett Street. The project site consists of 3.6906 acres of I-2 zoned land. The overall property is bordered by Leggett Street on the east, property of OBS Investments, LLC #47 Leggett Street (presently is I-2 zone, and is developed), AAJUS III, LLC to the west and south (presently is I-2 zone, and is developed).

This property presently is developed with a 71,615 sq. ft. 1 story brick and concrete block warehouse and distribution building. The area to the south of the existing buiding that is presently contains a bituminous pavement area that is used as a loading and parking. The remaining areas to the west, north and east of the building area presently lawn.

The soil types on this site consist of a Udorthents-Urban land complex (306).

This project site is located within the Connecticut River (Drainage Basin #4000) watershed as shown on a map entitled "Natural Drainage Basins, Major, Regional, Sub-regional and Local East Hartford, Connecticut, map created by CT DEEP dated January 2010"

In addition, this property is not located within a 100 year floodplain boundaries as delineated on the current Federal Emergency Management Agency (FEMA) Flood Insurance Rate Map (FIRM). A portion of this map has been included in the Appendix A of this report.

3. STORMWATER MANAGEMENT DESIGN

The proposed storm water management system has been designed utilizing BMPs design principles to safely convey storm water runoff from the site while providing storm water quality measures. Storm water management for the proposed project was achieved by collecting storm water from this portion of the development area of the site and conveying it to proposed Bio-Retention Basin and Bio-Retention Swale. The Basin and Swale have also been designed to attenuate the proposed peak flow rates and volume of runoff in order to prevent increases in the existing peak flow rates and volume of runoff post development. The collection system will incorporate several storm water quality measures designed to provide storm water treatment before discharging from the proposed project site. More information regarding water quantity (hydrology) can be found in Section 4. Storm water quality management is discussed further in Section 5.

The computer program entitled “Storm water Studio, ver. 2.0” by Hydrology Studio was used for designing the proposed storm drainage. Storm drainage computations performed include pipe capacity calculations, hydraulic grade line calculations, and gutter flow (inlet capacity) computations. The overall watershed was divided into sub-basins to determine the drainage area and land coverage to each individual catch basin inlet. These values were used to determine the storm water runoff to each inlet using the Rational Method. The rainfall intensities utilized in the storm drainage computations were obtained from the web based NOAA’s National Weather Service Hydrometeorological Design Studies Center Precipitation Frequency Data Server (PFDS) NOAA Atlas 14, Vol 10, Ver. 2 for 69 Leggett Street, East Hartford, CT.

The proposed storm drainage systems are required to be designed to the Town of East Hartford Manual of Technical Design to provide adequate pipe capacity to convey the 25-year storm event. Because the storm drainage system will also be used as the outlet from the Bio-Retention Swale and Basin, the analysis on this report was based on a 100 year storm event. In addition, the storm drainage design analysis includes a complete hydraulic grade line computation, which ensures adequate capacity for the 100-year storm event. All storm drainage computations described in this section are provided in the Appendix of this report.

4. HYDROLOGY ANALYSIS

The storm water management system has been designed in part to attenuate the proposed peak rates and volume of runoff from the project site. In order to analyze the pre development and post development peak flow rates from this site, the drainage area to the point where the majority of the stormwater runoff from this site discharges into the existing drainage system to the abutting property to the southwest of this site was used for this report. This drainage system drains in a westerly direction through a 15" culvert from the site into the existing drainage system . The outlet location of this system was not able to be determined in the field. This subarea is referred to as SA-A and SA-B which has a total area of 4.7566 acres as shown on a watershed map for both pre and post condition is included in the appendix H of this report. The reaming area to the north is referred to as SA-C and drains into an existing drainage system along the northerly property, which discharges to an existing detention basin to the northwest of the site. This subarea is also shown on a watershed map for both pre and post condition is included in the appendix H of this report.

The principal method of predicting the surface water runoff rates utilized in this analysis is a computer program entitled "Hydrology Studio V. 2.0.039". The "Hydrology Studio" computer modeling program utilizes the same methods for computing runoff rates that were originally developed by the U.S. Department of Agriculture, Natural Resources Conservation Service (NRCS, formerly known as the Soil Conservation Service or SCS), also utilized in the TR-20 computer modeling program and others. The "Hydrology Studio" computer program forecasts the rate of surface water runoff and river flow rates based upon several factors. The input data includes information on land use, hydrologic soil type, and vegetation conditions, contributing watershed area, time of concentration, rainfall data, storage volumes, and the hydraulic capacity of structures. The computer model predicts the amount of runoff as a function of time, including the attenuation affect due to flow restriction at roadway culverts, ponds, large wetlands, and floodplains. Runoff rates during specific rainstorms may vary due to different assumptions concerning soil moisture, water levels in ponds, snowmelt, and rainfall patterns. The input data for rainfalls with statistical recurrence frequencies of 2, 10, 25, 50, and 100 years were obtained from the NOAA's National Weather Service Hydrometeorolgical Design Studies Center Precipitation Frequency Data Server (PFDS) NOAA Atlas 14, Vol 10, Ver. 2 for #39 Leggett Street, East Hartford, CT analysis a Type III rainfall pattern with 24-hour duration was used.

The land use for the site under pre and post conditions was determined from field survey, the proposed site development plans for the on-site drainage areas. Land use types used in the analysis included paved areas and lawn areas (with good land cover). Soil types in the watershed were determined from the available GIS (Geographic Information System) database of the NRCS soil survey for Hartford County, Connecticut. The study area was determined to contain hydrologic soil type B as classified by the NRCS and as shown on attached mapping in Appendix A of this report.

The pre-conditions were modeled with the Hydrographs computer program to determine the flow rates & volumes for the various storm events at the analysis point. A revised model was developed incorporating the post site conditions, and flows obtained with the revised model were then compared to the results of the existing conditions model. The underground infiltration basin was incorporated into the proposed model, which illustrated the attenuation capabilities of this structure.

The NRCS Reservoir routing subroutine utilized within the Hydro Studio computer program was used to design the storage and outlet control requirements. All Hydrographs input computations and model results are included in the Appendix F (for pre-development conditions) and Appendix G (for post development conditions) of this report.

Storm water management for the project was achieved by routing the storm water runoff from the developed subareas of the site through the Bio-Retention Swale & Basin . The storm water discharge rates and volumes from these systems will be attenuated by setting the outlet spillway elevation 1' above the bottom of the Bio Retention Swale elevation.. This will allow for the retention of a portion of the volume of the storm water runoff to be retained within the bottom of the system. Because the soil type in the area is a Udorthents, we were unable to obtain a exfiltration rate form the USDA soils property. Therefore we had a sieve analyses preformed on samples we obtained from the site. Based on these analyses, the material description for this soils was a "sandy-silt" . Based on this soil type, a conservative exfiltration rate of 0.5 inch / hour was incorporated into the storm water modeling for these systems. The following is the Underground Detention Systems routing results and the peak flows is as follows:

Proposed Bio Retention Basin

Storm Frequency	1	2	5	10	25	50	100
Peak Inflow (c.f.s.)	0.548	0.810	1.291	1.715	2.310	2.780	3.248
Peak Outflow (c.f.s.)	0.000	0.000	0.030	0.217	0.677	1.097	1.555
Max. Water Surface El.	49.74	50.09	50.54	50.66	50.85	50.98	51.11
Max. Storage Vol .(cu. ft..)	830	1,351	2,183	2,458	2,876	3,173	3,502

Proposed Bio Retention Swale

Storm Frequency	1	2	5	10	25	50	100
Peak Inflow (c.f.s.)	3.141	1.790	6.050	7.559	9.607	11.55	13.67
Peak Outflow (c.f.s.)	0.584	5.058	4.639	6.367	8.365	10.17	12.18
Max. Water Surface El.	49.06	49.12	49.24	49.29	49.35	49.39	49.44
Max. Storage Vol .(cu. ft..)	4,174	4,600	5,312	5,662	6,026	6,327	6,639

The analysis point , as shown on the existing and proposed conditions watershed maps, was used to determine the peak flow rates. This analysis point was chosen based on the fact that they both receive some storm water runoff from a portion of the project site. Therefore, the pre and post hydrology analysis of these areas provided a comparison of the peak flow rates that ultimately provided guidance when designing the storm water management system. The sum of the pre and post development flows to this analysis point is as follow:

Peak Flow at Design Point 1 (existing drainage off- site to existing drainage system to south)

Peak Flow Rates (cfs)*

Storm Frequency (years)	1	2	5	10	25	50	100
Pre-Development flow rate	5.31	7.43	10.99	13.99	18.09	21.26	24.39
Post-Development flow rate	2.46	5.06	9.20	11.85	15.28	18.27	21.33

*cfs = cubic feet per second

Peak Runoff Volume at Design Point 1 (existing drainage from this site to existing drainage system in Darlin Street)

Peak Runoff Volumes (cu. ft.)

Storm Frequency (years)	1	2	5	10	25	50	100
Pre-Development Volume	21,772	30,442	45,303	58,140	76,024	90,099	104,119
Post-Development Volume	11,748	17,997	29,020	39,389	54,095	65,847	77,657

For more detailed information of these routings, see Appendix H “Storm water Studio”™ Computer Model Report-Post-Development” in this report. For more detail information of these routings, see Appendix H “Storm water Studio”™ Computer Model Report-Post-Development” in this report.

The summary of results above shows that no increases in peak rates of runoff volume are anticipated from this site post development for a 1, 2, 5, 10, 25, 50 & 100 year storm event. Rather, a decrease in rate and volume for these storm events can be anticipated due to the storm water management system and the detention provided.

Peak Flow at Design Point 2 (to existing drainage system to north)

Storm Frequency (years)	Peak Flow Rates (cfs)*						
	1	2	5	10	25	50	100
Pre-Development flow rate	1.56	2.26	3.456	4.479	5.886	6.981	8.061
Development flow rate	1.590	2.25	3.363	4.306	5.596	6.596	7.581

*cfs = cubic feet per second

Peak Runoff Volume at Design Point 2 (to existing drainage system to north)

Storm Frequency (years)	Peak Runoff Volumes (cu. ft.)						
	1	2	5	10	25	50	100
Pre-Development Volume	5,381	7,726	11,816	15,392	20,414	24,388	28,359
Post-Development Volume	5,445	17,997	11,541	14,887	19,562	23,247	26,921

5. WATER QUALITY MANAGEMENT

Several water quality measures or BMPs are incorporated into the storm water management design to maintain water quality. All of the best management control measures described in this section will help maintain the water quality of the storm water runoff from the proposed development.

Storm water runoff from the proposed site will be collected and conveyed via a subsurface pipe and catch basin drainage system. The drainage system will include catch basins with four-foot sumps with hooded outlet, which trap coarse sediments. The four-foot stumps and hooded outlets utilized in the storm drainage design will increase the system's ability to remove suspended solids and trap floatable debris before discharging to the underground infiltration systems.

Providing this water quality measure serves several purposes including storm water renovation, first flush retention, and ground water recharge. A more detailed explanation of each of these measures follows.

The Storm water Quality Manual (Chapter 7) also recommends methods for sizing storm water treatment measures with the Water Quality Volume (WQV) and computations. The WQV addresses the initial storm water runoff also commonly referred to as the "first flush" runoff. The WQV provides adequate volume to store the initial one inch of runoff, which tends to contain the highest concentrations of potential pollutants. Supporting calculations for the volume provided as well as WQV computations have been included in the Appendix of this report.

The storm water management system incorporates an Underground Infiltration System. The system is in accordance with the Connecticut Department of Environmental Protection's (CT DEP) Storm water Quality Manual (SWQM), Chapter 11,(Secondary (S) Treatment Practices - Innovative/Emerging Technologies) . The proposed Underground Infiltration System will have an isolator row which was designed to treat 100% of the Water Quality Volume (WQV).

The Storm water Quality Manual (Chapter 7) also recommends methods for sizing storm water treatment measures with the Water Quality Volume (WQV) and computations. The WQV addresses the initial storm water runoff also commonly referred to as the "first flush" runoff. The WQV provides adequate volume to store the initial one inch of runoff, which tends to contain the highest concentrations of potential pollutants. Supporting calculations for the volume provided as well as WQV computations have been included in the Appendix of this report.

6. BEST MANAGAMENT PRACTICES

STORMWATER SYSTEM MAINTENANCE

The site will be maintained in a clean condition at all times by implementing good housekeeping measures. Trash and surface debris will be removed from parking areas and storm water structures. The site will be regularly cleaned of trash and debris. Storm water structures (i.e., catch basins, underground detention systems, bio-retention swales, etc.) and outfalls will be cleaned of sediment and debris at least once a year during the month in the spring (once snow melt is complete) and at other times as necessary to prevent the off-site discharge of pollutants from the structures or outfalls. Special attention will be directed to the bio-retention swale identified on the site engineering drawings.

Storm water Management Structures	Checked for...
Catch Basins	Accumulated sediment & debris
Bio-Retention Swale & Basin	Accumulated sediments, debris, evidence of erosion, etc.

A member of the maintenance crew will complete thorough, quarterly inspections and complete inspection checklists.

SWEEEPING SCHEDULE

All parking areas, sidewalks, loading areas and driveways will be swept as needed, with automatic air sweeping and vacuuming equipment

Yard Maintenance

1. Mowing

- After irrigation, mowing is the most important maintenance operation. With good mowing practices, density, texture, color, root development, wear tolerance and other aspects of turf quality are enhanced, and a healthy turf minimizes the need for use of fertilizers and pesticides.
- When the turf is mowed too closely, it becomes less tolerant of environmental stresses, more disease prone, and more dependent upon a carefully implemented cultural program. The best approach then, is to use a high mowing height.
- Anytime that grass is in a weakened condition, the mowing height will be raised immediately.
- Growth rate and mowing height have the most influence on mowing frequency. As a rule of thumb, mowing should be done often enough that no more than 30 percent of the leaf is removed at any one mowing. This practice minimizes the effect of mowing on photosynthesis and helps maintain a high percentage of leaf surfaces, which is necessary for healthy root development.
- Varied mowing patterns on all surfaces encourage upright growth and reduce wheel or mower wear and compaction.
- Research has shown that returning grass clippings to the surface does not greatly increase thatch building up on turf that is otherwise properly managed. Clippings do have significant nutrient value and decompose rapidly thus returning some fertilizer and organic matter to the soil. They also help conserve moisture and insulate the soils

Erosion and Sediment Control Measures

A detailed Sediment and Erosion (S&E) Control Plan has been developed to mitigate the short-term impacts of the development during construction. The S&E Control Plan includes a detailed proposed construction sequence in addition to descriptive specifications concerning land grading, top soiling, temporary vegetative cover, permanent vegetative cover, and vegetative cover selection and mulching, and erosion checks. Details have been provided for all erosion control measures with corresponding labels on the S&E control site plan. In addition, the S&E controls provided are in accordance with the 2002 Connecticut Guidelines for Soil Erosion and Sediment Control manual. Specific measures are outlined on sheets #5 & 7 of the plans.

Conclusions

This report demonstrates that all design criteria set forth by the State of Connecticut and Town of East Hartford have been met or exceeded, and all design and mitigation measures have been derived from standard practices and procedures as directed by the Connecticut DEEP 2004 Storm water Quality Manual and DOT design manuals. Based the summary of the post development peak flows and volumes to the design point outlined in section 4 "HYDROLOGY ANALYSIS", it has been demonstrated that there will be a reduction of to the existing drainage system to the south. As outlined in Section 5 "Storm water Quality Measures and Section 6 "Best Management Practices", this storm water management report demonstrates that the post development storm water quality will be improved prior to discharging into the Town or State drainage system. In conclusion, the proposed project will satisfy all design requirements as have been stipulated by the Town, State and Federal regulations that may apply.
